MEDGRID SENTINEL — DISCLOSURE STATEMENT

Anneru IAS Global Energy Hackathon 2026 · Team: Team MedGrid Sentinel — Jackson Sixtus Abetianbe (solo entry) · Brief #13 · Track 2 (Digital Solutions & AI) · Setting B (Non-residential)

---

1. WHAT EXISTED BEFORE THE SPRINT (October 30, 2026, 12:00 PM ET)

- Nothing of this project. The repository began at the sprint start ("Initial commit", empty except git metadata).
- No prior code, designs, data, or text was brought into the submission. No repository tag for prior work was needed.

2. WHAT WAS BUILT DURING THE SPRINT

- The complete MedGrid Sentinel application: deterministic microgrid simulation engine (PV, battery, genset, grid, PQ, tiered dispatch, metrics), 58-test suite, Next.js product UI (dashboard, digital twin, scenario lab, financials, intelligence, brief, sources), financial/forecasting/sizing engines, documentation set, and all submission artifacts.
- Verification performed during the sprint: `npm test` (58/58 passing), `npm run build` (production build), `npm run results` (canonical results snapshot), production-server smoke test.

3. AI TOOLS USED (permitted under Handbook §13/§17 with disclosure)

- ZCode (GLM-based coding agent): used as the development instrument for code generation, testing, documentation and artifact preparation, working from the team's execution brief. All outputs were defined, reviewed and accepted as the team's work product for this entry.
- No AI-generated video, imagery or fabricated evidence was used. The demo and pitch videos are deliberately not produced by AI; they are recorded by the team (scripts and runbooks provided).
- No confidential or personal information was entered into any AI tool.

4. OPEN-SOURCE CODE AND LIBRARIES (standard licenses, used unmodified)

- Next.js 15, React 19, TypeScript, Tailwind CSS 3.4, Recharts 2.15, Zustand 5, lucide-react, clsx, Vitest 2, tsx — per package.json / package-lock.json (npm registry, install during sprint).

5. DATASETS

- No external datasets ingested. All simulation inputs (facility loads, irradiance, prices) are synthetic or clearly-labelled illustrative defaults defined in-repo and disclosed in docs/ASSUMPTIONS_AND_LIMITATIONS.md. "Measured" forecast history is synthetic (seeded) and labelled as such in-product and in docs/AI_AND_FORECASTING_METHODOLOGY.md.

6. EXTERNAL API SERVICES

- None. The application has no runtime API dependencies, no keys, and functions fully offline.

7. THIRD-PARTY ASSETS

- None beyond the open-source libraries above. Branding is text-based (no third-party logos).

8. SOURCES / REFERENCES

- Public sources consulted for statistics are registered with URLs, access dates and confidence levels in docs/DATA_SOURCES.md (e.g., EM-ONE/RIPLE NSIA-LUTH announcement; ICIR/APGC grid counts; NERC tariff orders; NBS diesel price watch).

9. OWNERSHIP

- The team retains ownership of the work, subject to the event's judging and promotion agreement (Handbook §13). Nothing here is derived from confidential partner data; no patient data exists anywhere in the project.

Declaration: the statements above are true to the best of the team's knowledge at submission time.

Team representative: Jackson Sixtus Abetianbe
